(54) Title: AUDIO INFORMATION DISPLAY IN A MULTIMODE DISPLAY DEVICE

(57) Abstract: The present invention relates to a multimode display device (101) comprising a display area, where said display device is, in a first mode, adapted for displaying display-focused applications on the display area, where said display device is, in a second mode, adapted for displaying audio-specific information on the display area describing audio being played back and where the display device is, in a third mode, adapted for simultaneously displaying independent display-focused applications and audio-specific information on the display area, the device comprises: receiving means (307) adapted for receiving audio data comprising said audio-specific information; processing means (309) adapted for displaying said audio-specific information on said display area. Thereby the user can choose to view the audio-specific information on the display device, while listening to the audio. Because of the separate processing means for adding the audio-specific information on the display area, the information can be added without obstructing the view of the display-focused application. This can advantageously be used e.g. for the FM Radio feature in an LCD TV Monitor product, where the user can view the FM Radio channel frequency when selecting different radio broadcasting stations.
